

Start with the structure.

Five considerations for a more useful protection conversation.

01 Look at the whole envelope

Map the areas exposed to water or moisture: below-ground spaces, wet rooms, roofs and terraces. Consider how those areas connect.

02 Describe the exposure

Discuss the source and timing of moisture, the location of visible symptoms and the conditions around the structure. Avoid assuming one cause from a surface mark alone.

03 Understand the surface

Identify the substrate and existing materials. Site readiness, access, junctions and penetrations all belong in the planning discussion.

04 Ask for the approved details

Use current product-specific technical information. Confirm compatibility, application sequence and any testing or inspection requirements with the responsible professionals.

05 Coordinate the people

Bring the owner, consultant, contractor and product team into the same discussion. Agree on responsibilities and the information needed for the next decision.

General planning information only. This guide does not specify a product or installation system and does not replace a qualified project assessment.
